

Project Design Phase
Proposed Solution Template

Date	7 July 2026
Team ID	SWTID-2026-5839
Project Name	Visualizing Housing Market Trends: An Analysis of Sale Prices and Features using Tableau
Maximum Marks	2 Marks

Proposed Solution Template:

S.No.	Parameter	Description
1.	Problem Statement	The housing market contains a large amount of property data such as sale price, bedrooms, bathrooms, flat area, basement area, house age, renovation status, waterfront view, overall grade. Analysing these attributes manually is difficult and time-consuming, making it challenging for buyers, sellers, and real estate professionals to identify price trends and make informed decisions.
2.	Idea	Develop an interactive Tableau dashboard that converts housing data into meaningful visualizations. The dashboard analyses average sale prices, house age, renovation status, basement area, bedrooms, bathrooms, floors, and other property features, enabling users to compare houses easily and make informed decisions based on data-driven insights.
3.	Novelty	The project combines multiple housing attributes into a single interactive dashboard with filters and visual analytics. Instead of examining raw data, users can instantly identify pricing patterns, renovation impact, and property characteristics through clear visualizations, improving the efficiency of housing market analysis.

4.	Social Impact	The dashboard helps home buyers, sellers, investors, and real estate agents understand market trends more effectively. It reduces the time required for property comparison, supports transparent pricing decisions, and improves customer confidence through easy-to-understand visual reports.
5.	Business Model (Revenue Model)	The dashboard can be adopted by real estate agencies, property consultants, and housing market analysts as a decision-support tool. Future versions may include premium market reports, subscription-based analytics, or
		customized dashboards for real estate businesses.
6.	Scalability of the Solution	The solution can easily be expanded by integrating larger housing datasets, additional geographic locations, real-time property information, predictive analytics, and advanced Tableau dashboards without changing the overall project architecture.
